Game Manual (Choice Adventure)

INTRODUCTION

Choice Adventure is a text-based console game where the plot of the story depends on the player's choices or various random events that might occur with different chance depending on the selected difficulty level. The story text is displayed letter by letter, making the story engaging and easy-to-read.

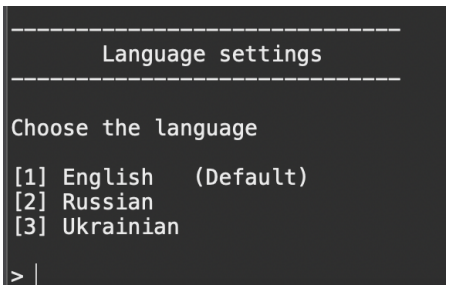

MENU

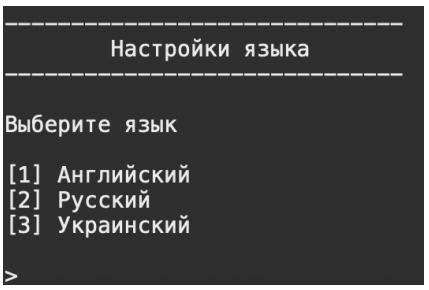

After running the program, the game title is displayed using ASCII art, and an intuitive menu that allows the player to start the game, exit, or adjust the settings before beginning: set the speed, difficulty, language.

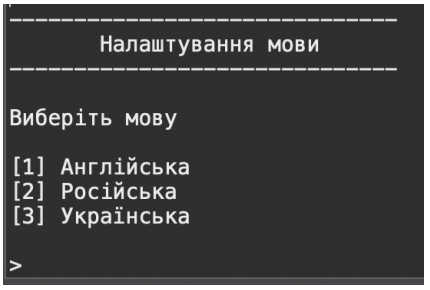

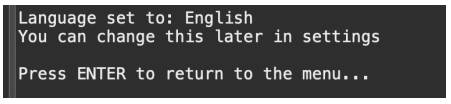

LANGUAGE SETTINGS

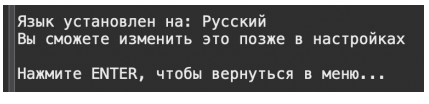

The game supports 3 languages: English (default one), Russian, Ukrainian. To change the language, the player has to enter the appropriate number (1-3). After that, it will ask to press "enter" to confirm or reenter if the input is invalid.

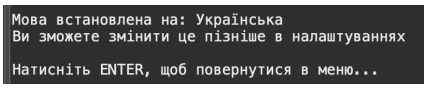

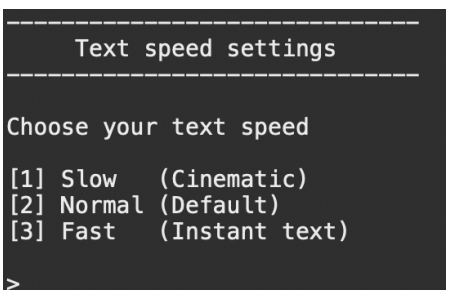

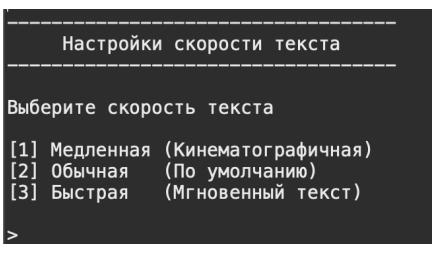

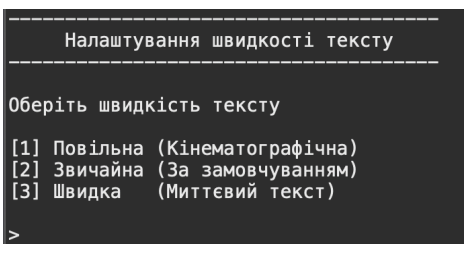

SPEED SETTINGS

The game also allows choosing the speed of the text display speed (Normal, 30mls per letter is a default one). To change the speed, the process is the same as for setting the language.

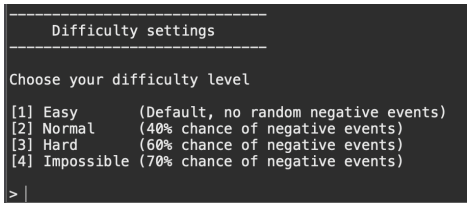

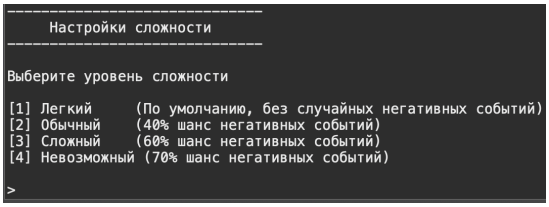

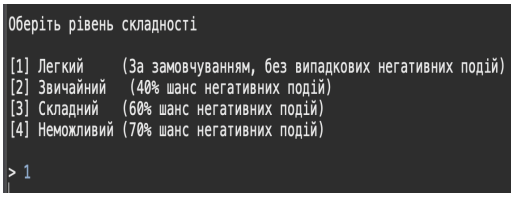

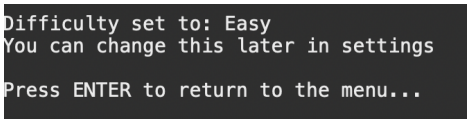

DIFFICULTY SETTINGS

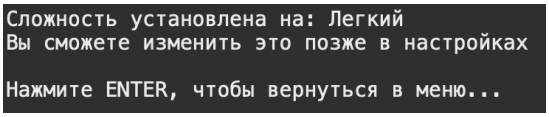

The game allows selecting the level of difficulty (Easy is the default one), the process is the same, but it ranges from 1 to 4.

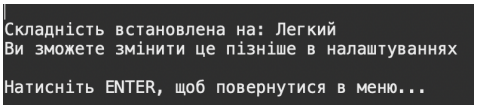

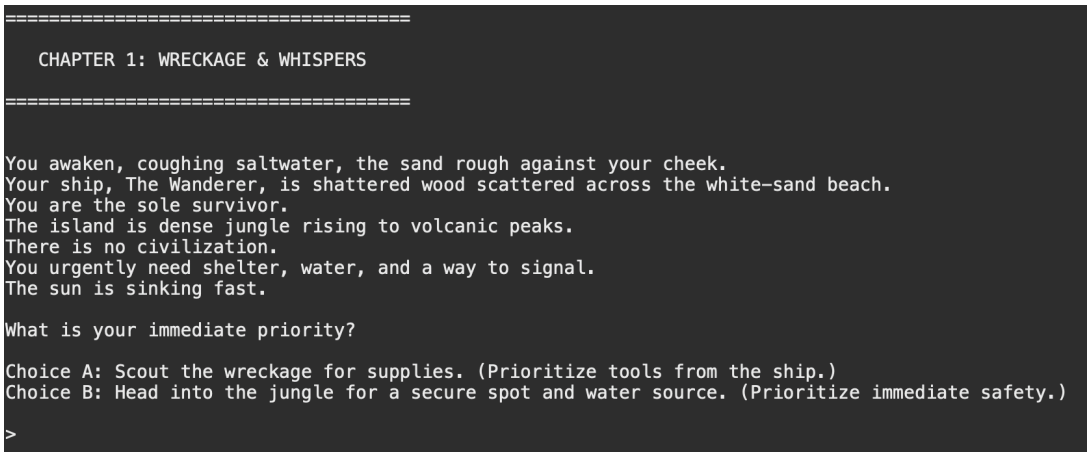

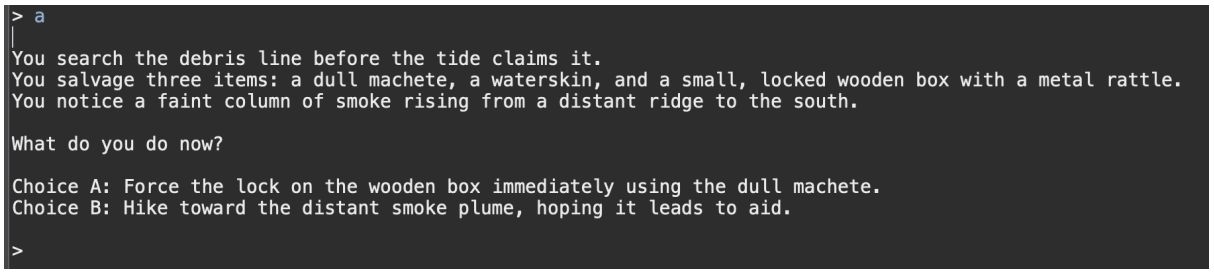

GAMEPLAY

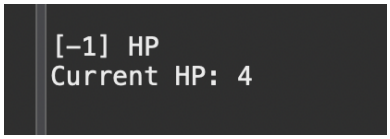

The game presents the part of the story and asks the user to choose between 2 options (A or B). Depending on the selected option, the plot continues either in positive or negative direction and may eventually lead to victory or lose. Also, the level of difficulty significantly affects the outcome of the story, since the probability of negative events increases with higher difficulty level.

For instance, if the user chose option “A”, the plot continues this way and then asks the player to make the next choice.

When the player makes a negative choice or faces bad luck, a certain number of health points is subtracted. If it reaches 0 or below, the game ends and displays a loss message. However, if the player makes a beneficial choice, it adds HP or just shows his current HP and the story continues.

VICTORY/GAME OVER

If the player reaches a positive ending with HP greater than 0, a victory message is displayed. Conversely, if the user's HP reaches 0 or less, the game ends with a Game Over message.
